

GRAVITY POWER

The twin rotor TZUY TURBINE uses the power of gravity. The weight of the water inside the water tank is much heavier than the water inside the two pipes.

These two forces of water from the water tank and from the 2 pipes are opposing against each other using the surface of the power side of the blade and the exhaust side of the blade of the TZUY TURBINE. Since the weight of water inside the two pipes is much lighter, it will be pushed upward back to the water tank for cyclical operation.

The twin-rotor TZUY TURBINE will continuously rotate because inside the turbine it has a big difference of inequality of two opposing forces that exist within the turbine.

This is a small electric power plant using the twin-rotor TZUY TURBINE to energize a single house with unlimited supply of electrical energy.
